

## Press Release

### COMPRION launches Smart Card testing product during Cartes 2006

**Paris - November 7, 2006 – COMPRION presents ICC Spectro – A revolutionary all-in-one Smart Card testing and measurement product. ICC Spectro will open up new dimensions for every user having a need for interference-free electrical measurement and testing, robust and reproducible testing of electrical requirements and the communication protocol of Smart Card products.**

COMPRION has extended its product portfolio with a terminal simulator that enables testing and measuring of Smart Cards from the electrical level up to the application level, through all the relevant layers of the OSI model.

Based on many years of experience with test equipment for Smart Card interfaces, the COMPRION hardware & software engineers have created the ICC Spectro: The most stable, most interference-free and comprehensive test and measurement device for Smart Cards available on the market.

Due to its specially designed hard- and software systems, ICC Spectro provides testing of ISO/IEC 7816 technology with outstanding accuracy and stability. ICC Spectro combines a logical terminal simulation with an Analog Signal Generator and Digital Sampling Oscilloscope in one unit. It comes with pre-defined test cases for electrical and protocol testing. Customers are also able to generate their own test cases through the ICC Spectro API.

Applicable to card vendors, chipset manufacturers, network operators, issuers and test labs, ICC Spectro is foreseen to be the standard test device for everyone involved with the lifecycle of a Smart Card, be it Chip Card development, production or introduction into the end-user market.

For more information, please contact the global COMPRION sales network.
